MHA’s road maps provide hospitals and health systems with evidence-based recommendations and standards for the development of topic-specific prevention and quality improvement programs, and are intended to align process improvements with outcome data. Road maps reflect published literature and guidance from relevant professional organizations and regulatory agencies, as well as identified proven practices. MHA quality and patient safety committees provide expert guidance and oversight to the various road maps.

Each road map is tiered into fundamental and advanced strategies:
- **Fundamental strategies** should be prioritized for implementation, and generally have a strong evidence base in published literature in addition to being supported by multiple professional bodies and regulatory agencies.
- **Advanced strategies** should be considered in addition to fundamental strategies when there is evidence the fundamental strategies are being implemented and adhered to consistently and there is evidence that rates are not decreasing and/or the pathogenesis (morbidity/mortality among patients) has changed.

**Operational definitions** are included to assist facility teams with road map auditing and identifying whether current work meets the intention behind each road map element.

**Resources** linked within the road map include journal articles, expert recommendations, electronic order sets and other pertinent tools which organizations need to assist in implementation of best practices.

The CDI road map includes best practices for the prevention and control in hospitals. The strategies include the appropriate identification and management of patients with suspected and/or confirmed CDI, cleaning and disinfection of the environment, antibiotic stewardship, staff and patient education, among other topics. It is important to note that appropriate testing for CDI is critical for best practice implementation and patient outcomes. The best practices are appropriate for patients with signs and symptoms compatible with CDI (e.g., clinically significant diarrhea). Some patients may have the bacteria without signs or symptoms of infection – testing asymptomatic patients is not clinically useful, and may lead to unnecessary antibiotic use.

Additionally, the road map includes planning for CDI outbreak situations whereby some of the advanced measures for patient isolation and cleaning/disinfection become fundamental.

| Clinical processes for CDI testing, continued | □ The facility has a process in place to evaluate retesting of patients diagnosed and treated for CDI who continue to be symptomatic.  
□ “Tests of cure” are not conducted post treatment [1,2,5].  
□ The facility has a process in place for diagnostic testing of pediatric patients. The process includes [1,6]:  
- Patients ≤ 12 months of age: not routinely testing for CDI.  
- Patients 1-2 years of age: not routinely testing for CDI unless other infectious or noninfectious causes have been excluded.  
- Children ≥2 years of age: testing for CDI in patients with prolonged or worsening diarrhea and risk factors (e.g., underlying inflammatory bowel disease or immunocompromising conditions) or relevant exposures (e.g., contact with the health care system or recent antibiotics).  
□ The facility has a process in place for timely communication of CDI test results [1,3,4,7].  
- Includes timely communication to: patient care unit/facility, provider, infection prevention, and patient and/or family. | Patient engagement is an important component of CDI prevention and treatment. Consider the following examples when developing teaching materials:  
- Centers for Disease Control and Prevention FAQs about Clostridiodies Difficile  
- Fairview Health Services Clostridiodies Difficile infection patient education  
- Mount Sinai Hospital Special Isolation Precautions for Clostridiodies Difficile (C. difficile)  
- The Ohio State University Medical Center Clostridiodies Difficile patient education |
| Patient & family education | FUNDAMENTAL  
(check each box if “yes”)  
□ The facility has a process in place to educate patients diagnosed with CDI.  
- Education includes topics such as symptoms of CDI, what the health care personnel/prescribers are doing to prevent infection, and what the patient can do to help prevent an infection [1]. | Isolation precautions help prevent infections that are spread through touch in the environment. Consider the following when developing organizational processes for the use of precautions:  
- CDC Frequently Asked Questions about Clostridiodies Difficile for Healthcare Providers  
- CDC Clostridiodies Difficile Infection (CDI) Toolkit  
- CDC Clostridiodies Difficile Infection (CDI) Prevention Primer |
| Isolation precautions | FUNDAMENTAL  
(check each box if “yes”)  
□ Patients with confirmed CDI are placed in a private room [1-4,7-9] with a bathroom or bedside commode solely for use by patient [3].  
□ HCP and prescribers perform hand hygiene and don gloves and gown prior to entering patient room [1-4,7-10]. | |

</table>
### Environmental cleaning and disinfection

**Fundamental (check each box if “yes”)**
- The environmental services director and infection preventionist partner to ensure effective cleaning and disinfection strategies [3].
- Environmental services staff is notified of patient rooms requiring enhanced cleaning and disinfection.
- Chlorine-containing or other sporicidal product/technology is used for daily and terminal environmental disinfection for all CDI patient rooms and patient care equipment, per organizational policy [1,3,4].
- The routine cleaning and disinfection processes are evaluated periodically through direct practice observation.
  - For example, use a visual inspection process with checklist.

**Advanced (check each box if “yes”)**
- The facility’s cleaning and disinfection processes include an evaluation of the use of chlorine-containing or other sporicidal product/technology used for daily and terminal environmental disinfection for all patient rooms and patient care equipment on CDI-affected unit if transmission is ongoing [2,3,7-9,11].
- Routine cleaning/disinfection processes are evaluated periodically through a technology-based approach using a biochemical product (e.g., fluorescent markers, ATP bioluminescence, cultures) [1,3,4,7].

Environmental cleaning is a critical component of CDI prevention. Consider the following resources when developing cleaning and disinfection processes:

- MHA Environmental Services Cleaning Guidebook
- CDI Environmental Cleaning in the O.R. and the E.D. toolkit
- MHA webinar: Environmental Interventions to Reduce *Clostridiodies Difficile*
- CDC Options for Evaluating Environmental Cleaning
- CDC Environmental Checklist for Monitoring Terminal Cleaning
- CDC Environmental Cleaning Evaluation Worksheet
- CDC Options for Evaluating Environmental Cleaning [See: Level II]
- MHA UV Gel Testing Procedure

| Antimicrobial stewardship & medication management | **FUNDAMENTAL** *(check each box if “yes”)*  
- The facility has an antibiotic stewardship program that follows the Centers for Disease Control and Prevention’s Core Elements of Hospital Antibiotic Stewardship Programs [12,13].  
- The facility collaborates with medical staff to set clear expectations for appropriate antibiotic use and follows current national recommendations for CDI treatment, e.g., guidelines developed by the Society for Healthcare Epidemiology of America (SHEA) and the Infectious Diseases Society of America (IDSA) [2] and the American College of Gastroenterology [5].  
- Appropriate CDI patient management includes: avoiding antiperistaltic agents for patients suspected/diagnosed with CDI [2,5]; Consultation with specialists when recurrent or worsening CDI is identified (e.g., infectious disease physician, general surgeons). | Antimicrobial stewardship is an essential component of reducing the incidence of CDI infection. Facility antibiotic stewardship programs should follow the CDC [Core Elements of Hospital Antibiotic Stewardship Programs](https://www.cdc.gov/abx/abxcoreelements.html). Consider the following selected implementation resources to support antibiotic stewardship work:  
- MHA Antibiotic Stewardship collaborative [webinars](https://www.mnhospital.org/antibiotic-stewardship) |
| Performance improvement monitoring | **FUNDAMENTAL** *(check each box if “yes”)*  
- The facility has a process to measure and monitor CDI prevention processes and outcomes.  
  - CDI prevention processes include: compliance with guidelines/best practices (e.g., isolation precautions, hand hygiene, etc.) and evaluation of the education program provided to staff and licensed independent practitioners.  
  - CDI outcomes include CDI rates using evidence-based metrics (e.g., NHSN).  
- The facility has a process in place to assess appropriateness of testing in the patients from which samples are submitted. This may involve periodic medical record review in a sample of patients to assess for clinical risk factors, signs and symptoms suggestive of CDI [1]. | Surveillance is the foundation of infection prevention efforts. The National Healthcare Safety Network (NHSN) provides standardized definitions for reporting through their [Multidrug-Resistant Organism & Clostridiodies Difficile Infection (MDRO/CDI) Module](https://www.cdc.gov/nhsn/pdfs/pscManual/3-CDI.pdf).  
The Greater New York Hospital Association United Hospital Fund, Appendix C has a useful [CDI Tracking Tool](https://www.nyshaf.org/cdi-tracking-tool). |
| Staff education | **FUNDAMENTAL** *(check each box if “yes”)*  
- Basic education on isolation precautions is conducted as part of the orientation process. |  |
